

ALPHA-BETA PRUNING

Aim

To write a Python program to implement the Alpha-Beta Pruning Algorithm.

Objective

To improve the Minimax algorithm by pruning unnecessary branches.

Algorithm

1. Start.
2. Read the game tree values.
3. Initialize Alpha and Beta values.
4. Compare the scores.
5. Prune unnecessary branches.
6. Display the best score.
7. Stop.

Source code:

```
scores = [3, 5, 2, 9]
alpha = max(scores)
beta = min(scores)
print("Alpha =", alpha)
print("Beta =", beta)
print("Best Score =", alpha)
```

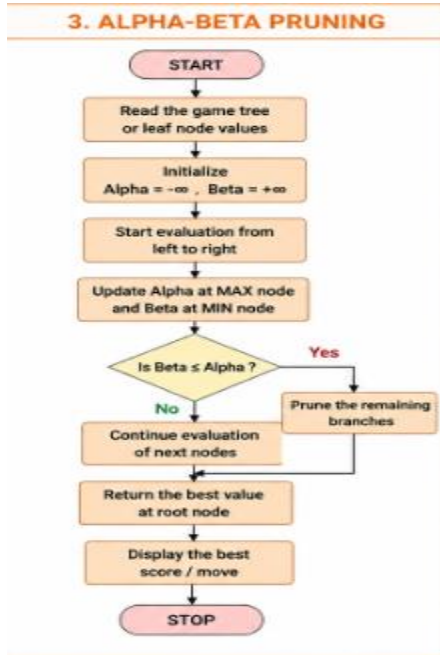

Sample Output

Alpha = 9

Beta = 2

Best Score = 9

FLOWCHART:

Result

Thus, the Python program to implement Alpha-Beta Pruning was executed successfully.
